

**THE COPPERBELT UNIVERSITY  
SCHOOL OF MATHEMATICS AND NATURAL SCIENCES**

**CHEMISTRY DEPARTMENT**

**TEST 1 – 13<sup>th</sup> July 2014**

**COURSE CODE – CH 110 /CH 120/ FO 130**

**TIME ALLOWED: TWO (02) HOURS**

**INSTRUCTIONS TO CANDIDATES:**

1. *This paper comprises 3 questions, and is printed on pages 2, 3 and 4. Candidates are expected to attempt **ALL** questions.*
2. *Each question carries **twenty (20)** marks.*
3. *Candidates are reminded of the need for the **clear presentation** in their answers.*
4. *All the parts of a question should be answered **strictly in continuation**.*
5. *A **table of constants and the periodic table** are provided on pages 5 and 6, respectively.*

**QUESTION ONE (Introduction)**

$3.85 \times 10^5$

**[15 Marks]**

- a. Use exponential notation to express the number 385,500 to:
- (i) one significant figure. [1]
  - (ii) three significant figures.
- b. Perform the following mathematical operations, and express each result to the correct number of significant figures.
- (i)  $(6.404 \times 2.91) \div (18.7 - 17.1)$
  - (ii)  $\frac{2.526}{3.1} + \frac{0.470}{0.623} + \frac{80.705}{0.4326}$  [2]
- c. A star is estimated to have a mass of  $2 \times 10^{36}$  kg. Assuming it to be a sphere of average radius  $7.0 \times 10^5$  km, calculate the average density of the star in units of grams per cubic centimeter. [2]
- d. Diamonds are measured in carats, and 1 carat = 0.200 g. The density of diamond is  $3.51 \text{ g/cm}^3$ .
- (i) What is the volume of a 5.0-carat diamond? [2]
  - (ii) What is the mass in carats of a diamond measuring 2.8 mL? [2]
- e. In a scientific method, what is the importance of formulating a hypothesis? [1]
- f. Define the terms
- (i) Nuclide (ii) Nucleon (iii) Mass Number (iv) Isotopes [4]
- g. One isotope of copper is  $^{65}\text{Cu}$ . Give the number of its neutrons and protons. [2]
- h. What decimal fraction of a second is a pico-second, ps? [1]
- i. The ideal gas equation is given by  $PV = nRT$ , where P is pressure in Newton per square area, V is volume, n is the number of moles, T is temperature and R is the gas constant. Show by units analysis that the derived unit of R =  $\text{Joule} \cdot \text{mol}^{-1} \cdot \text{K}^{-1}$ . [3]

$4.9 \times 10^{11}$

$\frac{f}{A}$

## QUESTION TWO (Atomic Theory)

[20 Marks]

- a. The atomic weight of copper is 63.646 amu. The two naturally occurring isotopes of copper have the following masses:  $^{63}\text{Cu}$ , 62.9298 amu;  $^{65}\text{Cu}$ , 64.9278 amu. Calculate the percent abundance of  $^{65}\text{Cu}$  in nature. [2.5]
- b. State each of the following:
  - (i) Heisenberg uncertainty principle (ii) Pauli exclusion principle
  - (iii) Hund's rule (iv) Electron affinity (v) Electronegativity [2.5]
- c. In the electronic configuration representation  $3d^5$ :
  - (i) What does each of the numbers 3 and 5 represent? [2]
  - (ii) Which quantum number is represented by the symbol "d"? [1]
- d. Copper is the 29<sup>th</sup> element in the periodic table of elements, for copper:
  - (i) Give the ground state electronic configuration [2]
  - (ii) Draw the orbital diagrams for the electronic configuration in d(i) above [2]
  - (iii) Give the set of the four quantum numbers for the 3<sup>rd</sup> electron in ground state of copper [1]
  - (iv) Give the set of the four quantum numbers for the 19<sup>th</sup> electron in ground state of copper. [1]
  - (v) Which electron in the ground state of copper has the following set of the four quantum numbers;  $(3, 0, 0, -\frac{1}{2})$  [1]
- e. Calculate the;
  - (i) Energy difference in joules between  $n=1$  and  $n=5$  principal energy levels of a hydrogenic atom. [2]
  - (ii) de Broglie wavelength of a boy of mass 10.5 kg experiencing translational motion at 18 km/h. [3]

$$\begin{array}{r} 29 \\ 12 \\ \hline 17 \end{array}$$

$$1.5 \times 10^{-14} \text{ m}$$

$$1.09678 \times 10^{-14} \text{ m}$$

**QUESTION THREE (Chemical Bonding and Molecular Geometry)**

**[20 Marks]**

- a. Using Lewis symbols, diagram the reaction between  
(i) magnesium and oxygen atoms to give the ionic compound magnesium oxide  
(ii) lithium and nitrogen atoms to give the ionic compound lithium nitride. [4]
- b. Define the term **lattice enthalpy**. Which factors govern the magnitude of the lattice enthalpy of an ionic compound? [2]
- c. Explain the following trends in lattice enthalpy:  
(i)  $\text{MgO} > \text{MgCl}_2$   
(ii)  $\text{NaCl} > \text{RbBr} > \text{CsBr}$  [4]
- d. Using Lewis symbols and Lewis structures diagram the formation of the following molecules from their atoms  
(i)  $\text{PF}_3$  (ii)  $\text{HBr}$  (iii)  $\text{H}_2\text{S}$  and (iv)  $\text{CH}_4$  [8]
- e. How many lone pairs of electrons are in the underlined atoms in the compounds of d. [2]

Physical Constants		
Constant	Symbol	Value
Atomic mass unit	$amu$	$1.660554 \times 10^{-27} \text{ kg}$
Avogadro's number	$N_A$	$6.02214 \times 10^{23} \text{ mol}^{-1}$
Bohr radius	$a_0$	$5.292 \times 10^{-11} \text{ m}$
Boltzmann's constant	$k$	$1.38066 \times 10^{-23} \text{ J K}^{-1}$
Charge of an electron	$e$	$1.60218 \times 10^{-19} \text{ C}$
Faraday's constant	$F$	$96,485 \text{ C mol}^{-1}$
Gas constant	$R$	$8.31451 \text{ J K}^{-1} \text{ mol}^{-1}$
		$0.08206 \text{ L atm K}^{-1} \text{ mol}^{-1}$
Mass of an electron	$m_e$	$9.10939 \times 10^{-31} \text{ kg}$
		$5.48580 \times 10^{-4} \text{ amu}$
Mass of a neutron	$m_n$	$1.67493 \times 10^{-27} \text{ kg}$
		$1.00866 \text{ amu}$
Mass of a proton	$m_p$	$1.67262 \times 10^{-27} \text{ kg}$
		$1.00728 \text{ amu}$
Planck's constant	$h$	$6.62608 \times 10^{-34} \text{ J s}$
Speed of light	$c$	$2.99792458 \times 10^8 \text{ m s}^{-1}$
$1 \text{ atm} = 760 \text{ mmHg} = 1.0132 \times 10^5 \text{ Nm}^{-2} = 1.0132 \times 10^5 \text{ Pa}$		

The Periodic Table

THE COPPERBELT UNIVERSITY  
SCHOOL OF MATHEMATICS AND NATURAL SCIENCES

CHEMISTRY DEPARTMENT

ANSWER - KEY

TEST 1 - 13<sup>th</sup> June 2014

COURSE CODE - CH 110 / CH 120 / FO 120

TIME ALLOWED: TWO (02) HOURS

INSTRUCTIONS TO CANDIDATES:

1. This paper comprises X questions, and is printed on x number of pages. Candidates are expected to attempt ALL questions.
2. Each question carries twenty (20) marks.
3. Candidates are reminded of the need for the clear presentation in their answers.
4. All the parts of a question should be answered strictly in continuation.

Patrick

mm

### Question One

- a. Use exponential notation to express the number 385,500 to:

i. one significant figure.

$$4 \times 10^5 \text{ (1 sig. figure)} \quad \frac{1}{2}$$

ii. three significant figures.

$$3.86 \times 10^5 \text{ (3 sig. figures)} \quad \frac{1}{2}$$

[1]

- b. Perform the following mathematical operations, and express each result to the correct number of significant figures.

i.  $(6.404 \times 2.91) \div (18.7 - 17.1)$

$$6.404 \times 2.91 = 18.6 \text{ (3 sig. figures)}$$

$$18.7 - 17.1 = 1.6 \text{ (1 decimal place)} \quad \frac{1}{2}$$

$$\text{Then } 18.6 \div 1.6 = \underline{12} \text{ (2 sig figures)} \quad \frac{1}{2}$$

ii.  $\frac{2.526}{3.1} + \frac{0.470}{0.523} + \frac{80.705}{0.4326}$

$$\frac{2.526}{3.1} = 0.81 \text{ (2 sig. Figures)}$$

$$\frac{0.470}{0.523} = 0.754 \text{ (3 sig. figures)}$$

$$\frac{80.705}{0.4326} = 186.6 \text{ (4 sig. figures)} \quad \frac{1}{2}$$

$$\text{Then } 0.81 + 0.754 + 186.6 = \underline{188.2} \text{ (1 decimal place)} \quad \frac{1}{2}$$

[2]

- c. A star is estimated to have a mass of  $2 \times 10^{36}$  kg. Assuming it to be a sphere of average radius  $7.0 \times 10^5$  km, calculate the average density of the star in units of grams per cubic centimeter.

Convert kg into g:

$$2 \times 10^{36} \text{ g}$$

Convert km into cm:

$$7.0 \times 10^{10} \text{ cm} \quad \frac{1}{2}$$

$D = \text{mass/volume.}$

$$\text{But volume of sphere} = \frac{4}{3}\pi r^3 = \frac{4}{3}(22/7)(7.0 \times 10^{10} \text{ cm})^3 = 1.44 \times 10^{33} \text{ cm}^3 \quad \frac{1}{2}$$

$$\text{So } D = 2 \times 10^{36} \text{ g} \div 1.44 \times 10^{33} \text{ cm}^3 = \underline{1 \times 10^3 \text{ g/cm}^3} \quad 1$$

d. Diamonds are measured in carats, and 1 carat = 0.200 g. The density of diamond is 3.51 g/cm<sup>3</sup>. [2]

i. What is the volume of a 5.0-carat diamond?

$$D = m/v \quad \text{So } v = m/D = 5 \times 0.200 \text{ g} \div 3.51 \text{ g/cm}^3 = \underline{0.28 \text{ cm}^3}$$

2

ii. What is the mass in carats of a diamond measuring 2.8 mL?

$$M = D \times V = 3.51 \text{ g/cm}^3 \times 2.8 \text{ mL} = 9.828 \text{ g}$$

$$9.828 \text{ g} / 0.200 \text{ g} = \underline{49 \text{ carats}}$$

2

e. In a scientific method, what is the importance of formulating a hypothesis? [4]  
(A hypothesis is an intelligent possible explanation of the problem, hence it guides in designing research and/or experiments)

f. Define the terms: [1]

i. **Nuclide** = General term applied to each atom represented by  ${}^A_Z X$ , where X is the symbol of an element

ii. **Nucleon** = particle in the nucleus (proton or neutron)

iii. **Mass number** = sum of protons and neutrons in the nucleus

iv. **Isotope** = atoms with same atomic number but differing mass number

g. One isotope of copper is <sup>65</sup>Cu. Give the number of its neutrons and protons. [4]  
The atomic number of 29 is obtained from the periodic table. Hence 29 protons, and (65 - 29) 36 neutrons

h. What decimal fraction of a second is a pico-second, ps? [2]  
**10<sup>-12</sup> sec**

[1]

i. The ideal gas equation is given by  $PV = nRT$ , where P is pressure in Newton per square area, V is volume, n is the number of moles, T is temperature and R is the gas constant. Show by units analysis that the derived unit of R = Joule. mol<sup>-1</sup>.K<sup>-1</sup>

$$\text{units: } P = F/A = N/m^2$$

$$V = m^3$$

$$n = \text{mol}$$

$$T = K$$

$$\text{So units of } R = (N/m^2 \cdot m^3) / \text{mol} \cdot K = N \cdot m / \text{mol} \cdot K$$

$$\text{But } N \cdot m = \text{joule}$$

$$= \underline{J \cdot \text{mol}^{-1} \cdot K^{-1}}$$

[3]

### QUESTION ONE (Introduction)

[15 Marks]

- a. Use exponential notation to express the number 385,500 to:
- one significant figure.
  - three significant figures.
- ( $4 \times 10^5$  and  $3.86 \times 10^5$ ) [1]
- b. Perform the following mathematical operations, and express each result to the correct number of significant figures.
- $(6.404 \times 2.91) \div (18.7 - 17.1)$
  - $\frac{2.526}{3.1} + \frac{0.470}{0.623} + \frac{80.705}{0.4326}$
- (12 and 188.1 ) [2]
- c. A star is estimated to have a mass of  $2 \times 10^{36}$  kg. Assuming it to be a sphere of average radius  $7.0 \times 10^5$  km, calculate the average density of the star in units of grams per cubic centimeter.
- ( $1 \times 10^6$  g/cm<sup>3</sup>) [2]
- d. Diamonds are measured in carats, and 1 carat = 0.200 g. The density of diamond is 3.51 g/cm<sup>3</sup>.
- What is the volume of a 5.0-carat diamond?
  - What is the mass in carats of a diamond measuring 2.8 mL?
- (0.28 cm<sup>3</sup> and 49 carats) [4]
- e. In a scientific method, what is the importance of formulating a hypothesis?  
(A hypothesis is an intelligent possible explanation of the problem, hence it guides in designing research and/or experiments)
- [1]
- f. Define the terms
- Nuclide
  - Nucleon
  - Mass Number
  - Isotopes
- Nuclide is the general term applied to each atom; represented by the  ${}^A_ZX$ , where X is the symbol of a particular element.
- Nucleon is a particle in an atomic nucleus, either a neutron or proton.
- Mass number is the sum of the number of neutrons and protons in an atomic nucleus.
- Isotopes are atoms of the same element (same atomic number) with different number of neutrons.

- g. One isotope of copper is  $^{65}\text{Cu}$ . Give the number of its neutrons and protons. [4]  
 (Mass number (A) = Number of protons (Z) + Number of neutrons (N). A=65 as given in the question; Z=29 as obtained from the periodic table. Therefore N=65-29=36) [2]
- g. What decimal fraction of a second is a pico-second, ps? (10<sup>-12</sup> sec) [1]
- h. The ideal gas equation is given by  $PV = nRT$ , where P is pressure in Newton per square area, V is volume, n is the number of moles, T is temperature and R is the gas constant. Show by units analysis that the derived unit of R = Joule·mol<sup>-1</sup>·K<sup>-1</sup>. [3]

## QUESTION TWO (Atomic Theory)

[20 Marks]

- a. The atomic weight of copper is 63.646 amu. The two naturally occurring isotopes of copper have the following masses:  $^{63}\text{Cu}$ , 62.9298 amu;  $^{65}\text{Cu}$ , 64.9278 amu. Calculate the percent abundance of  $^{65}\text{Cu}$  in nature.

ANSWER:

[2.5]

Let the % abundance of  $^{65}\text{Cu}$  be x and its mass be  $A_1$

Hence % abundance of  $^{63}\text{Cu}$  = 100-x and its mass be  $A_2$

$$\sum_{i=1}^n (\text{mass of isotope})(\% \text{ abundance}) = \text{average mass of atom.}$$

$$\text{Therefore: } A_1 \times \frac{x}{100} + A_2 \times \frac{100-x}{100} = 63.646$$

[0.5]

$$A_1 \cdot x + A_2 \cdot (100-x) = 63.646 \times 100$$

$$A_1 \cdot x + A_2 \cdot (100-x) = 6364.6$$

$$64.9278 \cdot x + 62.9298 \cdot (100-x) = 6364.6$$

$$64.9278 \cdot x + 6292.98 - 62.9298 \cdot x = 6364.6$$

$$64.9278 \cdot x - 62.9298 \cdot x = 6364.6 - 6292.98$$

$$1.998 \cdot x = 71.62$$

$$x = 35.84584585$$

$$x = 35.846 \%$$

- i. State each of the following:

[2]

- (i) Heisenberg uncertainty principle
- (ii) Pauli exclusion principle
- (iii) Hund's rule

- (iv) Electron affinity
- (v) Electronegativity

[2.5]

**ANSWER**

Heisenberg uncertainty principle is a principle stating that there is a fundamental limitation to how precisely both the position and momentum can be known at a given time. [0.5]

Pauli exclusion principle states that in a given atom no two electrons can have the same set of four quantum numbers. [0.5]

Hund's rule states that the lowest energy in an atom is the one having the maximum number of unpaired electrons allowed by the Pauli exclusion principle in a set of degenerate orbitals, with all unpaired electrons have parallel spins. [0.5]

Electron affinity is the energy change associated with the addition of an electron to a gaseous atom. [0.5]

Electronegativity is the tendency of atom in an atom to attract shared electrons to itself. [0.5]

In the electronic configuration representation  $3d^5$ ;

- (i) What does each of the numbers 3 and 5 represent?

[2]

**ANSWER:**

3 represents the principal quantum number "n" [1]

5 represents the number of electrons in the subshell. [1]

- (ii) Which quantum number is represented by the symbol "d"?

[1]

**ANSWER:** "d" represents the azimuthal quantum number [1]

Copper is the 29<sup>th</sup> element in the periodic table of elements, for copper:

- (i) Give the ground state electronic configuration,

[2]

**ANSWER:**  $1s^2 2s^2 2p^6 3s^2 3p^6 4s^1 3d^{10}$  [2]

- (ii) Draw the orbital diagrams for the electronic configuration in d(i) above

[2]

**ANSWER:**  $\begin{array}{cccccccccccc} \uparrow\downarrow & \uparrow\downarrow & \uparrow\downarrow & \uparrow\downarrow & \uparrow\downarrow & \uparrow\downarrow & \uparrow\downarrow & \uparrow\downarrow & \uparrow\downarrow & \uparrow & \uparrow\downarrow & \uparrow\downarrow & \uparrow\downarrow & \uparrow\downarrow \\ 1s & 2s & 2p & 2p & 2p & 3s & 3p & 3p & 3p & 4s & 3d & 3d & 3d & 3d \end{array}$  [2]

- (iii) Give the set of the four quantum numbers for the 3<sup>rd</sup> electron in ground state of copper

[1]

ANSWER: 3<sup>rd</sup> electron the set of the four quantum numbers is (2,0,0,+½) [1]

- (iv) Give the set of the four quantum numbers for the 19<sup>th</sup> electron in ground state of copper.

[1]

ANSWER: 19<sup>th</sup> electron the set of the four quantum numbers is (4,0,0,+½) [1]

- (v) Which electron in the ground state of copper has the following set of the four quantum numbers; (3, 0, 0, -½)

[1]

ANSWER: The electron with the set of four quantum numbers of (3, 0, 0, -½) is the 12<sup>th</sup> electron. [1]

e. Calculate the;

- (i) Energy difference in joules between n=1 and n=5 principal energy levels of a hydrogenic atom.

[2]

ANSWER:

$$\Delta E = A \left( \frac{1}{n_1^2} - \frac{1}{n_2^2} \right) \quad [0.5] \quad \text{Where } n_1 = 1, n_2 = 5, \text{ and } A = 2.18 \times 10^{-18} \text{J}$$

$$\Delta E = A \left( \frac{1}{1^2} - \frac{1}{5^2} \right)$$

$$\Delta E = \frac{24}{25} A$$

$$\Delta E = \frac{24}{25} \times 2.18 \times 10^{-18} \text{J}$$

$$\Delta E = 2.0928 \times 10^{-18} \text{J}$$

$$\Delta E = 2.09 \times 10^{-18} \text{J} \quad [1.5]$$

- (ii) de Broglie wavelength of a boy of mass 10.5 kg experiencing translational motion at 18 km/h.

[3]

ANSWER: de Broglie wavelength is given by the equation

$$\text{Wavelength} = \frac{h}{mv} \quad [1]$$

$$\text{where } h = 6.63 \times 10^{-34} \text{J}\cdot\text{s}, \quad m = 10.5 \text{ kg} \quad \text{and } v = 18 \text{ km/h} = 5 \text{ m/s}$$

$$\text{Wavelength} = \frac{6.63 \times 10^{-34} \text{J}\cdot\text{s}}{10.5 \text{ kg} \times 5 \text{ m/s}} \quad \text{Note: } 1 \text{ J} = 1 \text{ kg}\cdot\text{m}^2/\text{s}^2$$

$$\text{Wavelength} = \frac{6.63 \times 10^{-34} \text{kg}\cdot\text{m}^2\cdot\text{s}^2/\text{s}^2}{10.5 \text{ kg} \times 5 \text{ m/s}}$$

Wavelength =  $1.262857143 \times 10^{-35}\text{m}$

Wavelength =  $1.3 \times 10^{-35}\text{m}$

Hence the de Broglie wavelength is  $1.3 \times 10^{-35}\text{m}$

[2]
